Docket Number: 22171.391 Customer No.: 27683

## **Listing of Claims:**

(Currently Amended) A method of addressing a node in a network, comprising:
reading an identifier comprising an identification uniquely assigned to a subscriber;
translating the identifier into a group identification representative of a plurality of identifiers;
responsive to translating the identifier, indexing an address table [[with]] using the group
identification; and

mapping the group identification to a first node of the network.

- 2. (Original) The method according to claim 1, wherein translating the identifier into a group identification further comprises translating the identifier into one of a plurality of group identifications.
- 3. (Original) The method according to claim 1, wherein indexing an address table with the group identification further comprises indexing a record of the table having a field element corresponding to the group identification.
- 4. (Original) The method according to claim 1, wherein mapping the group identification to a first node further comprises mapping the group identification to a first node of a plurality of nodes of the network.
- 5. (Original) The method according to claim 1, wherein reading an identifier further comprises reading a text-based identifier.
- 6. (Original) The method according to claim 1, wherein translating the identifier further comprises translating the identifier by a hashing function.
- 7. (Original) The method according to claim 1, wherein translating the identifier into a group identification further comprises translating the identifier into a numerical-based group identification.

Docket Number: 22171.391 Customer No.: 27683

8. (Currently Amended) A message distributor for processing an identifier <u>uniquely assigned</u> to a subscriber and routing the identifier to a processing node, comprising:

a translation module for receiving the identifier and converting the identifier into one of a plurality of group identifications, wherein each of the plurality of group identifications may be obtained from a respective plurality of identifiers each respectively assigned to one of a plurality of subscribers; and

a first table including a plurality of records each indexable [[by]] <u>using</u> one of the plurality of group identifications, an indexed record including an element having a first address of [[the]]<u>a</u> processing node.

- 9. (Original) The message distributor according to claim 8, wherein the translation module is a hashing function.
- 10. (Original) The message distributor according to claim 8, wherein the identifier is a text-based identifier and the group identification is a numerical-based identification.
- 11. (Currently Amended) The message distributor according to claim 8, wherein the translation module is operable to translate a plurality of identifiers into a common group identification of the plurality of group identifications.
  - 12. (Original) The message distributor according to claim 8, further comprising: a processing element; and

a memory module maintaining the translation module and the first table, the translation module maintained by the memory module as an instruction set executable by the processing element.

- 13. (Currently Amended) The message distributor according to claim 8, wherein the identifier is included in a message received by the message <u>distributor and distributor</u>, the message <u>is routed</u> to the processing node by the message distributor upon indexing of the record.
- 14. (Currently Amended) The message distributor according to claim 8, wherein the message distributor is operable to receive a second identifier and the translation module is operable to translate the second identifier into a second group identification of the plurality of group identifications, and wherein a second record is indexed by the second group identification.

Docket Number: 22171.391 Customer No.: 27683

15. (Original) The message distributor according to claim 14, wherein the second record includes a second element having a second address.

- 16. (Original) The message distributor according to claim 15, wherein the second address is equivalent to the first address.
- 17. (Original) The message distributor according to claim 15, wherein the second address is different than the first address.
- 18. (Original) The message distributor according to claim 8, further comprising an interface with a plurality of processing nodes.
- 19. (Original) The message distributor according to claim 18, wherein the interface is a network interface.
- 20. (Original) The message distributor according to claim 18, wherein the interface is an address bus of the message distributor.
